Problem Statement: The number of incomplete or poor bowel prep orders for inpatients on wards SC3 and SC4 at the UAH is a concern. Incomplete bowel preparations may delay treatment decisions, negatively impact colonoscopy schedule, decrease pathology detection, increase length of stay, repeat procedures, increase cost, and delay patient experience (1).

Outcomes, repeat procedures, higher health care costs, and diminished patient experience (1).

Outcome Measures:
- 60% of residents and 85% of registered nurses attend bowel prep education in-service
- 100% of appropriate patients are provided standard bowel prep education at bedside
- 80% of the bowel prep orders use the standardized order label (reduce physician/resident bowel prep order variability)
