

Typography guidelines

Introduction

Consistency and legibility are key components of an effective sign system. This section defines:

- type style
- type size
- letter spacing
- word spacing
- line spacing
- arrow specifications

and illustrates how these are applied to the typography on interior and exterior signs.

General

- the typography guidelines apply to directional and informational signs; they also can apply, in a more general way, to all signs on campus
 - all type to be upper and lower case
 - the standard colours for interior signs are black type on a white surface
 - vinyl type can be:
 - Letrasign or equivalent
 - computer set and cut vinyl type (recommended)
 - 25 mm, 38 mm and 76 mm sizes can be applied directly to walls or windows where hanging or mounted signs are inappropriate
 - signs may be protected with a transparent acrylic face where vandalism is a significant problem
 - for producing large quantities of one sign, screen printing may be more economical than vinyl type; it is crucial that the type is consistent in style and feel with vinyl lettered signs
 - type size is specified in one of two ways:
 - cap-height
 - point size
- the table on this page can be used to convert point size to cap-height or visa versa

type size conversion table for Helvetica Bold

convert to point size to cap-height or visa versa

cap-height (millimetres)	cap-height (inches)	point size
12.5	0.5	50
15	0.6	60
25	1.0	100
38	1.5	150
50	2.0	200
76	3.0	300

all measurements in millimetres (mm) except where noted

Definition of terms

ascender

This is the portion of letter that extends above the x-height. Some type faces have ascenders that are taller than the cap-height.

baseline

A baseline is an imaginary line on which the base of letters align (see below).

cap-height

is the height of a capital letter measured in millimetres. Cap-height is a convenient method of specifying type. A conversion table relating to standardized sizes is available on page 21.

descender

This refers to the portion of a letter that extends below the baseline.

font

A font is a variation within a type style. Example: **Helvetica 10pt. Bold**, *Helvetica 10 pt. Italic*,

kerning

is the adjustment or fine tuning of inter-letter spacing for reasons of legibility and aesthetics.

line spacing

This is the horizontal space between lines of text. In this document, line spacing is measured from baseline to baseline.

letter spacing

is the distance between individual letters. These guidelines establish a standard letter spacing designed to maximize legibility.

point size

is a common method for specifying type size. The point size of a letter is the distance from the top of the longest ascender to the bottom of the descender. The relationship of point size

to x-height varies among type styles depending on the purpose for which the type style was designed. Helvetica, for example, appears larger than Times at the same point size because of comparably large x-height. Helvetica was designed with maximum legibility in mind and is an excellent type face for signs. Seventy two points equal one inch.

type style

A type style is a group of several related fonts (ex. roman, bold, italic, bold italic) that offer a harmonious result when used together. Some popular type styles are: Times, Helvetica, Palatino, Univers etc.

type size

specifies the height of type in terms of cap-height or point-size

x-height

is a typographic measurement: the distance from the baseline to the top of the lower case "x".

The above figure illustrates some of the typographic terms used throughout this section.

Type style

Helvetica Bold Roman is the type style used throughout the University of Alberta sign system. Since many versions of Helvetica exist, the illustration below indicates the weight and design desired. To be consistent with signs governed by the Sign Systems Guidelines, no other type style or font should be used unless otherwise approved by the Facilities Sign Systems Committee.

Helvetica Bold Roman

abcdefghijklmnop	ABCDEFGHIJ
ghijklmnopqrst	JKLMNOPQRS
vwxyz	TUVWXYZ
12345	WXYZ
67890	? ! & ; : , " ' ,

all measurements in millimetres (mm) except where noted

Type size

Unless otherwise specified, type sizes in this document will be indicated by the height of a capital letter (ie. cap-height). Cap-height is best determined by choosing a capital with a flat top and bottom (such as an “E”) and measuring its height. All measurements are in millimetres (mm). Five type sizes have been standardized as specified in the table below. See the type conversion table on page 2.1 to convert between point size and cap height.

Circumstances may arise where a type size, other than the standard sizes, is required. Use the following formula to determine the appropriate type size*.

To calculate type size for a known maximum reading distance:

$$C = 2.74 M$$

To calculate maximum reading distance for a known type size:

$$M = C/2.74$$

M = maximum reading distance (metres)
C = cap-height (millimetres)

type size table

specific type sizes should only be used with certain sign sizes

sign size (see section 3)	type size (cap-height)	max reading distance
■ 150 x 150 surface mounted	15 mm	5.5 metres
■ secondary lines on hanging signs ■ 300 x 300 surface mounted ■ applied directly to surface or window	25 mm	9 metres
■ all hanging signs ■ 600 x 600 surface mounted ■ applied directly to surface or window	38 mm	14 metres
■ applied directly to surface or window	50 mm	18 metres
■ 600 x 600 surface mounted ■ custom sign sizes ■ applied directly to surface or window	76 mm	27.5 metres

** In order to achieve success with these formulas, adherence to the typographic guidelines is required*

Type size (continued)

Illustrated are examples (actual size) of some of the standard type sizes.

all measurements in millimetres (mm) except where noted

Word spacing

Word space = 0.6 x cap-height

Letter spacing

Consistency and legibility of letter spacing are of key importance in designing signs. Although computer typesetting systems can never replace the aesthetic perception of the human eye, a standard is still required which the system can accommodate. The **letter spacing tables** and samples provided on the following pages will aid in achieving the desired letter spacing. This standard has been designed to maximize legibility.

The following type samples illustrate the desired feel for all typography on signs specified in the Sign Systems Guidelines. It is expected that the sign fabricator will take note of the samples and provide accurate quality typesetting.

all measurements in millimetres (mm) except where noted

Letter spacing (continued)

The **letter spacing unit** used for the adjacent illustration is relative to the size of the type, therefore it applies to all type sizes.

One unit equals one sixth of the stroke thickness of a letter, as illustrated in the adjacent figure.

The **letter spacing charts** on page 2.9 can be used to determine the proper spacing between two characters in a word. To use this chart, find the left character in the left column of the table and the right character in the top column. The number at the crosspoint of these two characters is the spacing required in units.

spacing example #6

DFOQS		1	2
BEGR	38	2	3
HIJMNU	1	3	4

1 unit = 1/6 stroke thickness

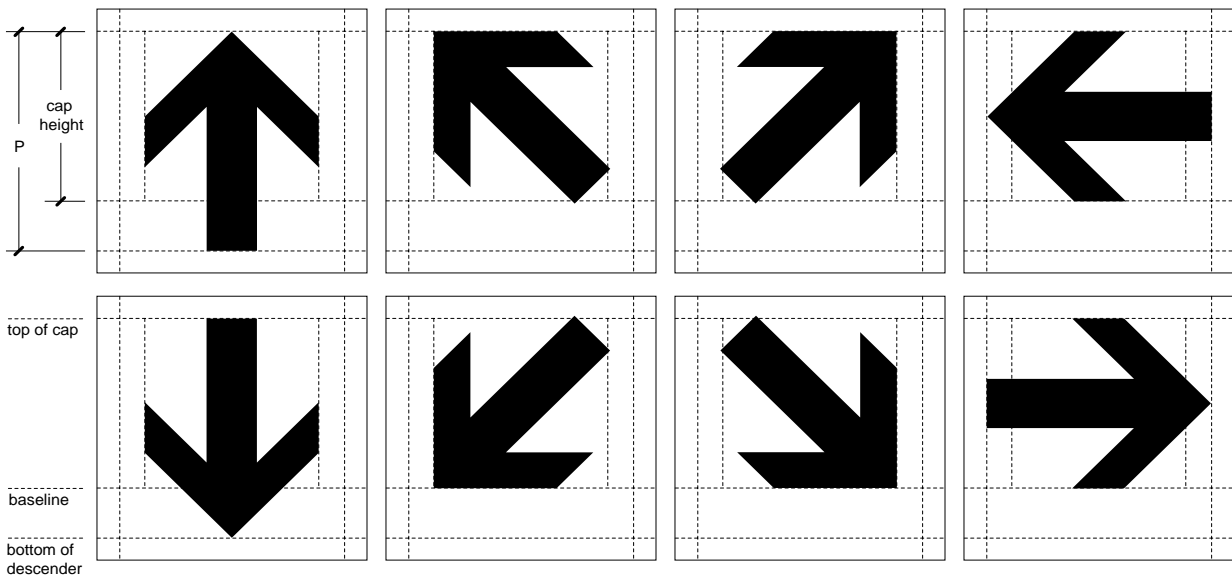

all measurements in millimetres (mm) except where noted

Arrow specifications

Arrow size corresponds directly to the size of type being used. The height of the horizontal arrow equals the cap-height. The width equals the distance from the top of the ascender to the bottom of the descender (see illustration below). These size guidelines apply to all arrow positions. **Arrow weight** should match the stroke weight of the type style.

Arrow with type

- the bottom of the horizontal arrow aligns with the baseline of the type
- the bottom of the vertical arrow aligns with the bottom of the type's descender
- the illustrations below show :
 1. the relationship of cap-height and point size (P) to the height and length of an arrow
 2. acceptable arrow positions

Line Spacing

The vertical distance between baselines of type is referred to as line spacing. Adequate line spacing contributes to the legibility and, like letter and word spacing, should be consistent.

The ratio of line space to letter size is constant throughout the system. The table below provides values of line spacing for the standard type sizes. A formula is also provided to determine the line spacing for custom type sizes.

formula

$$L = 1.68 C$$

L = line spacing
C = cap-height

line spacing table

use this table to determine line spacing for standard type sizes

cap-height (C) (mm)	line space (L) (mm)
15	25
25	42
38	64
50	84
76	128

all measurements in millimetres (mm) except where noted

Margin spacing

The margin spacing will vary with type size. The **margin spacing table** shown lists the standard type sizes and minimum margin spacing.

Sign layout should be determined by a qualified professional.

margin spacing table

determine minimum margin size given the type size

type size (mm)	margins left, right, top (mm)	bottom margin (mm)
15	15	20
25	25	40
38	40	40
50	40	40
76	50	50

The following are examples of how type is applied to commonly used signs. These illustrations can be used as a guide to determine the sign layout.

Identification signs

Room identification

All doors in a building are marked or signed for identification and maintenance purposes.

Installation

Room signs are installed on the basis of location priority:

1. on the wall adjacent to the door swing opening
2. on the wall adjacent to the door hinges
3. on the door face

The method of fastening signs to the wall varies depending on the wall surface.

Examples:

- smooth surfaces: double sided tape
- drywall and rough surfaces (i.e. brick): back plate attached with screws, sign applied with double sided tape.

Type is to be upper and lower case.

Under no circumstances shall ALL CAPS be used.

Only initials and surnames are to be used. Titles such as Mr., Mrs., Dr. etc. are not permitted.

All typography shall strictly follow specifications outlined herein.

Directional signs

Installation

Directional signs can be implemented in two ways:

■ suspended

- one type size used
- standard sizes established

■ surface mounted

- sign layout at the discretion of the sign designer
- type size optional (see standardized type sizes in typography guidelines)
- standard sign sizes established

Sequence of entries

The following sequence determines the rank of the entries on a directional sign from bottom to top of the sign:

1. left or right arrows (longest line first)
2. diagonal arrows (longest line first)
3. ahead arrows (longest line first)

All left arrows are to be placed on the left side of board and all right arrow lines on the right side.

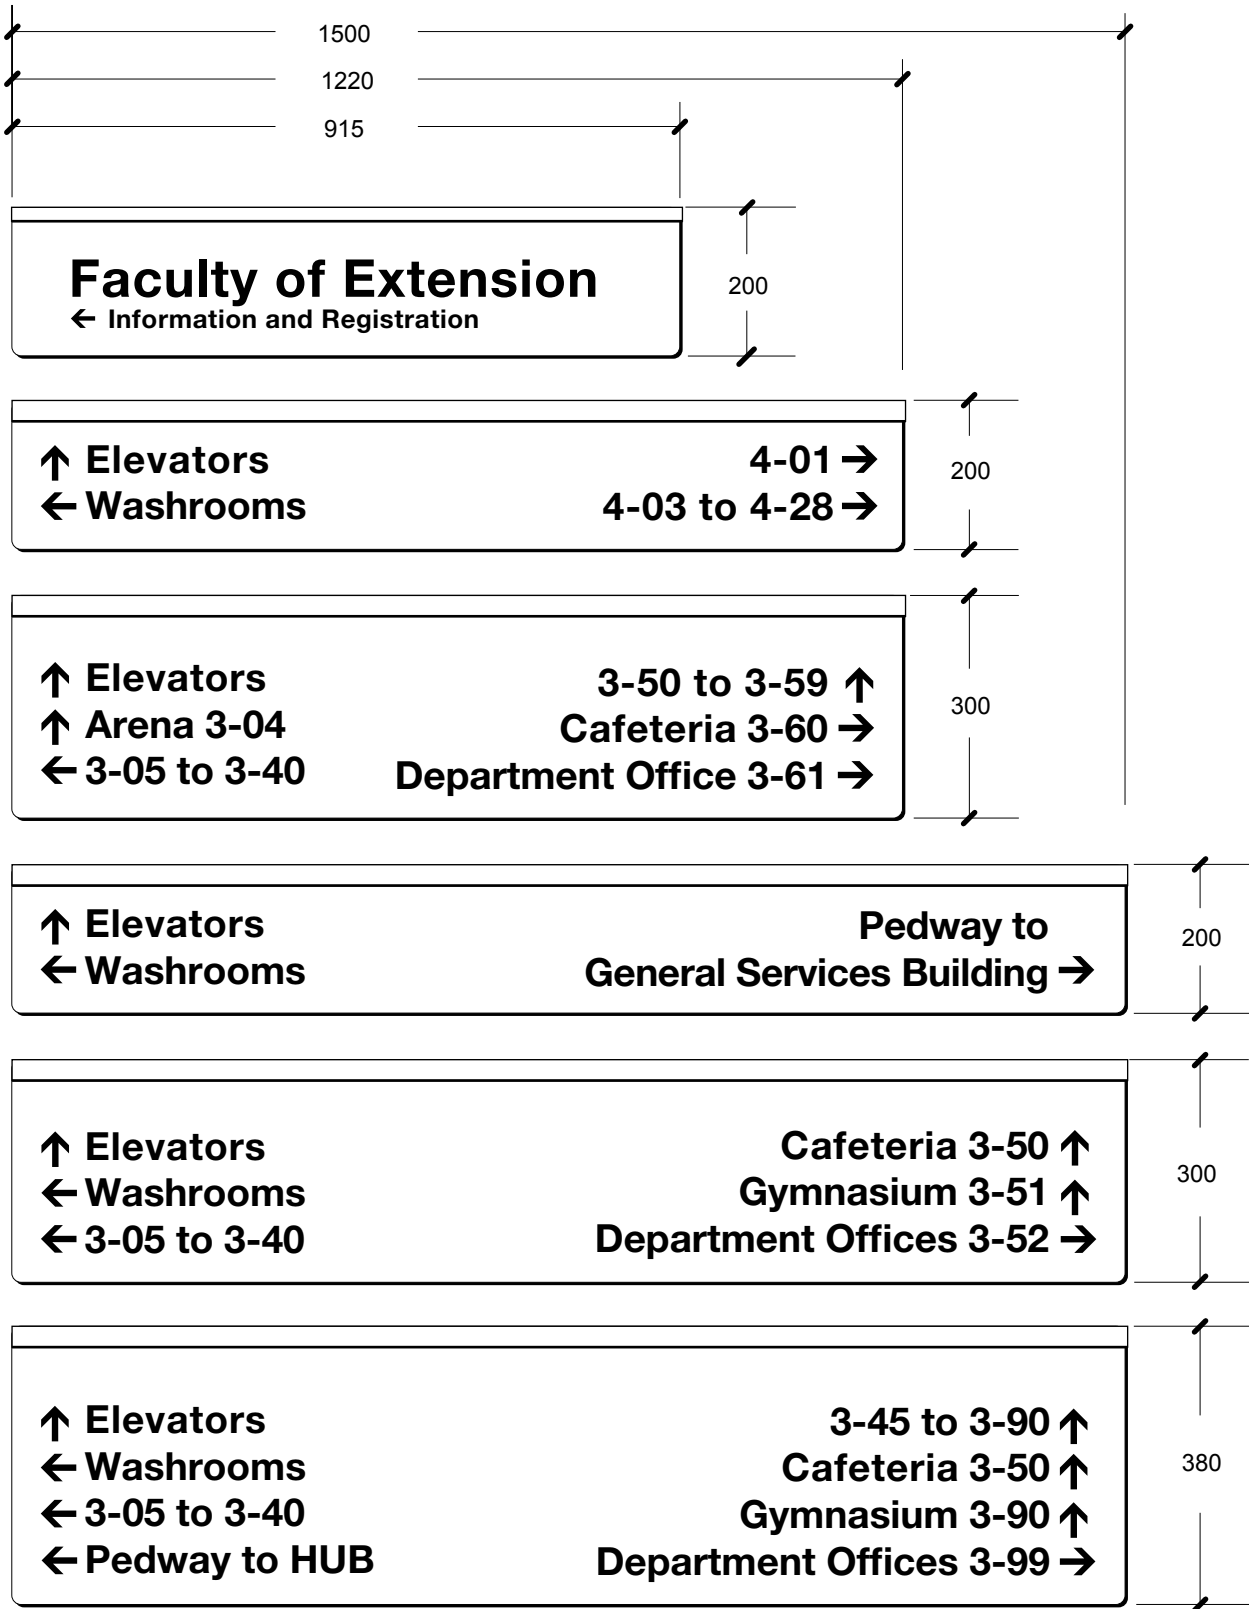

Ahead arrows are placed on the side that the eventual direction of travel will be, with one exception; if only one direction (left or right) is indicated, all ahead entries are to be stacked on that side, space permitting.

number of line entries for suspended directional signs

sign size will determine how many lines can be stacked on one side

sign size (mm)	number of lines
200 x 915	1 – 2 lines
200 x 1200	1 – 2 lines
300 x 1200	3 – 5 lines
200 x 1500	1 – 2 lines
300 x 1500	3 – 5 lines
380 x 1500	5 – 6 lines

Informational signs

Directories

Directories assist first-time or infrequent users with department, room and staff locations.

There are two types of directories:

1. Building directories are located at major entrances. If necessary, directional signs are installed at minor building entrances directing the user to the building directory. These directories contain the following information:

- name of building
- floor levels
- faculty/department locations
- special areas
- staff names

It is preferred that staff names do not appear on building directories but rather on individual floor directories.

Changes to directories are charged to the department requesting the update.

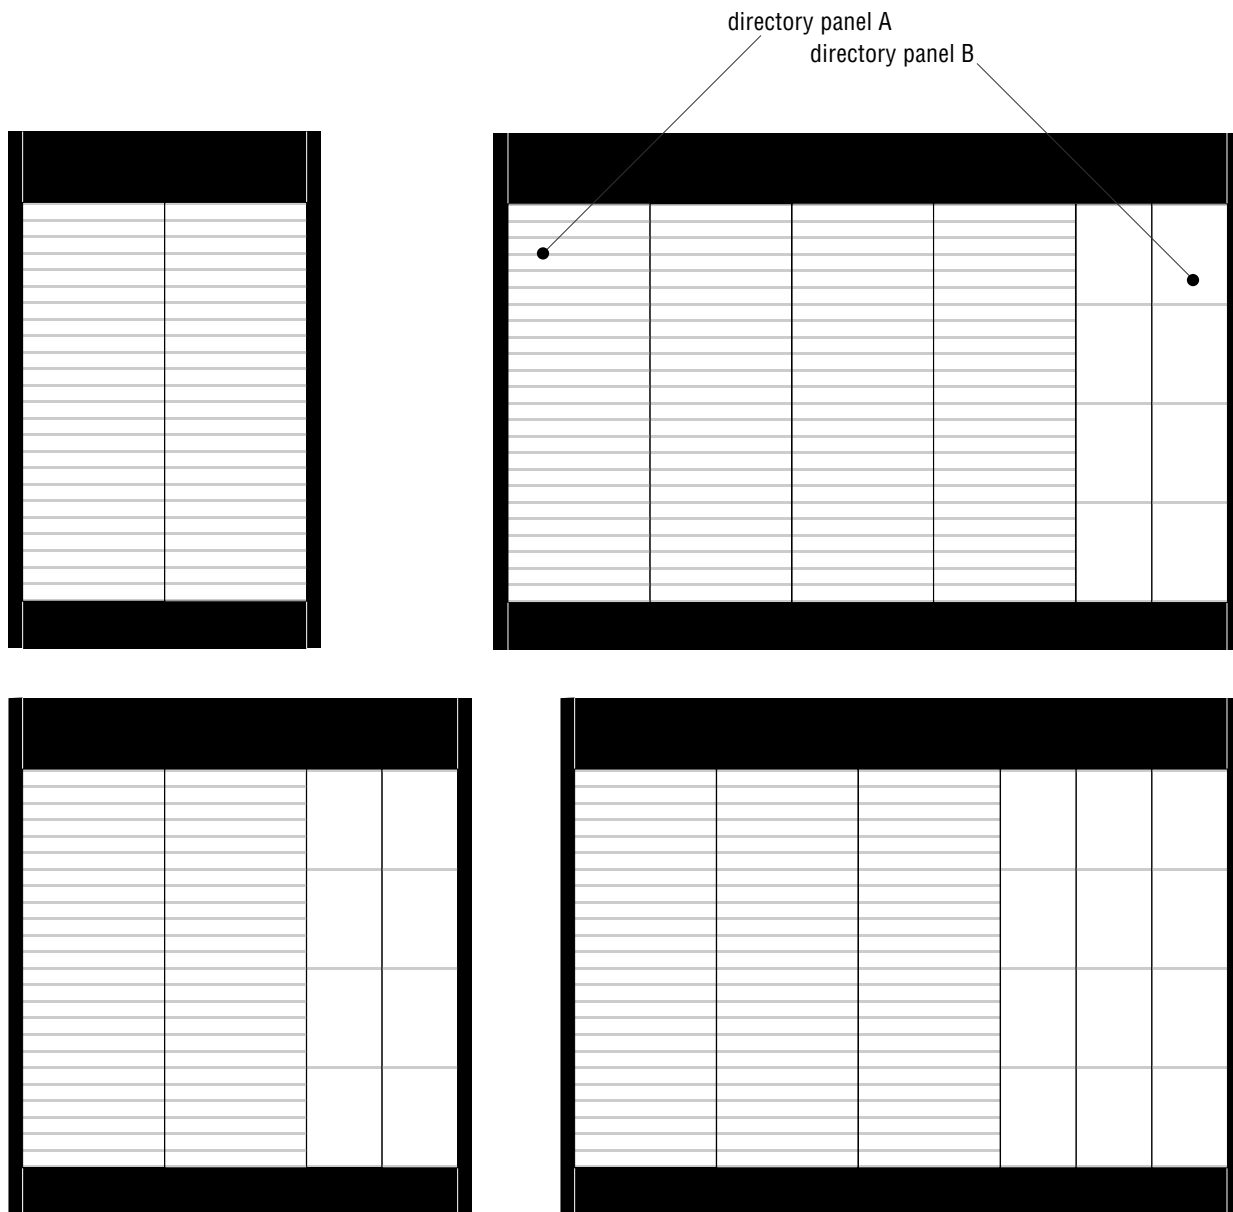

2. Floor directories are located at major entrances on specific floor levels. These directories list information pertaining to that level or Department only. Floor/Department directories contain the following:

- department / faculty name
- floor level
- department / faculty locations
- special areas
- staff names

Changes to directories are charged to the department requesting the update.

Basic directory components

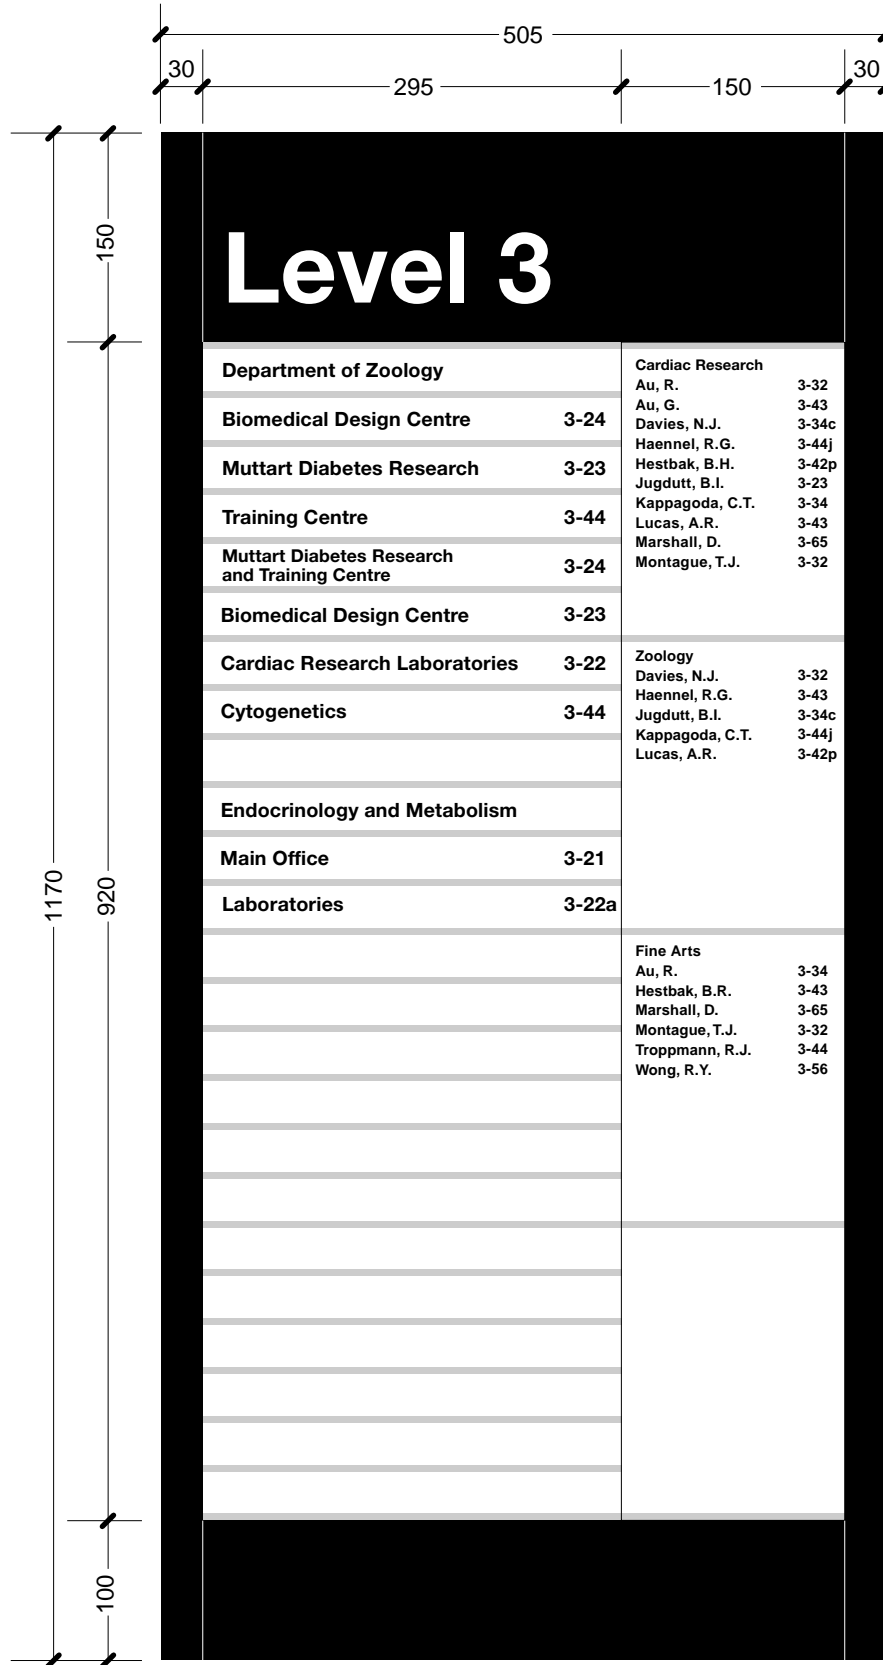

Directories secure two sizes of modular, transparent panels in place (see below). These panels house lettered inserts. The directories are manufactured such that the panels can slide out and be updated as needed. As illustrated below, the amount of panels required determines the dimensions of the directory.
