

### Western larch – Current

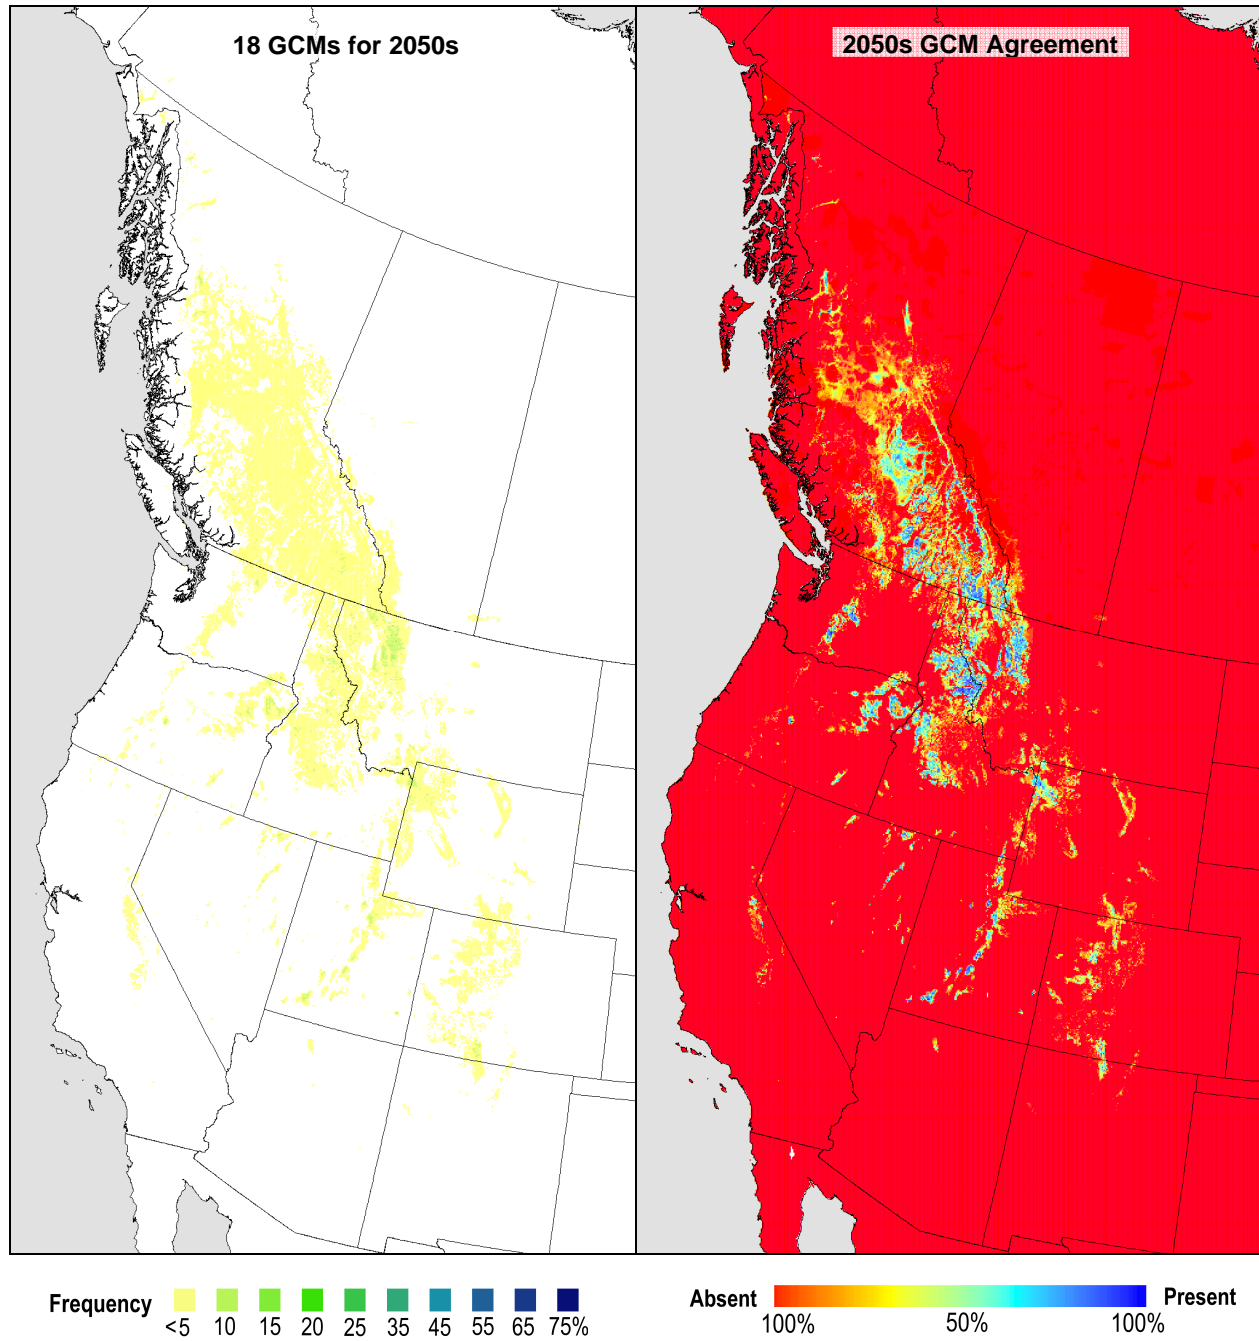

**Figure S11a.** Projected habitat of western larch (*Larix occidentalis* Nuttall). The left image is an expected frequency (% canopy cover projected to the ground) for the 1961-1990 normal period, representing long-term climate condition and model training data. The right image models habitat for the 1997-2006 period, representing a recent (25-year) climate trend.

### Western larch – 2020s

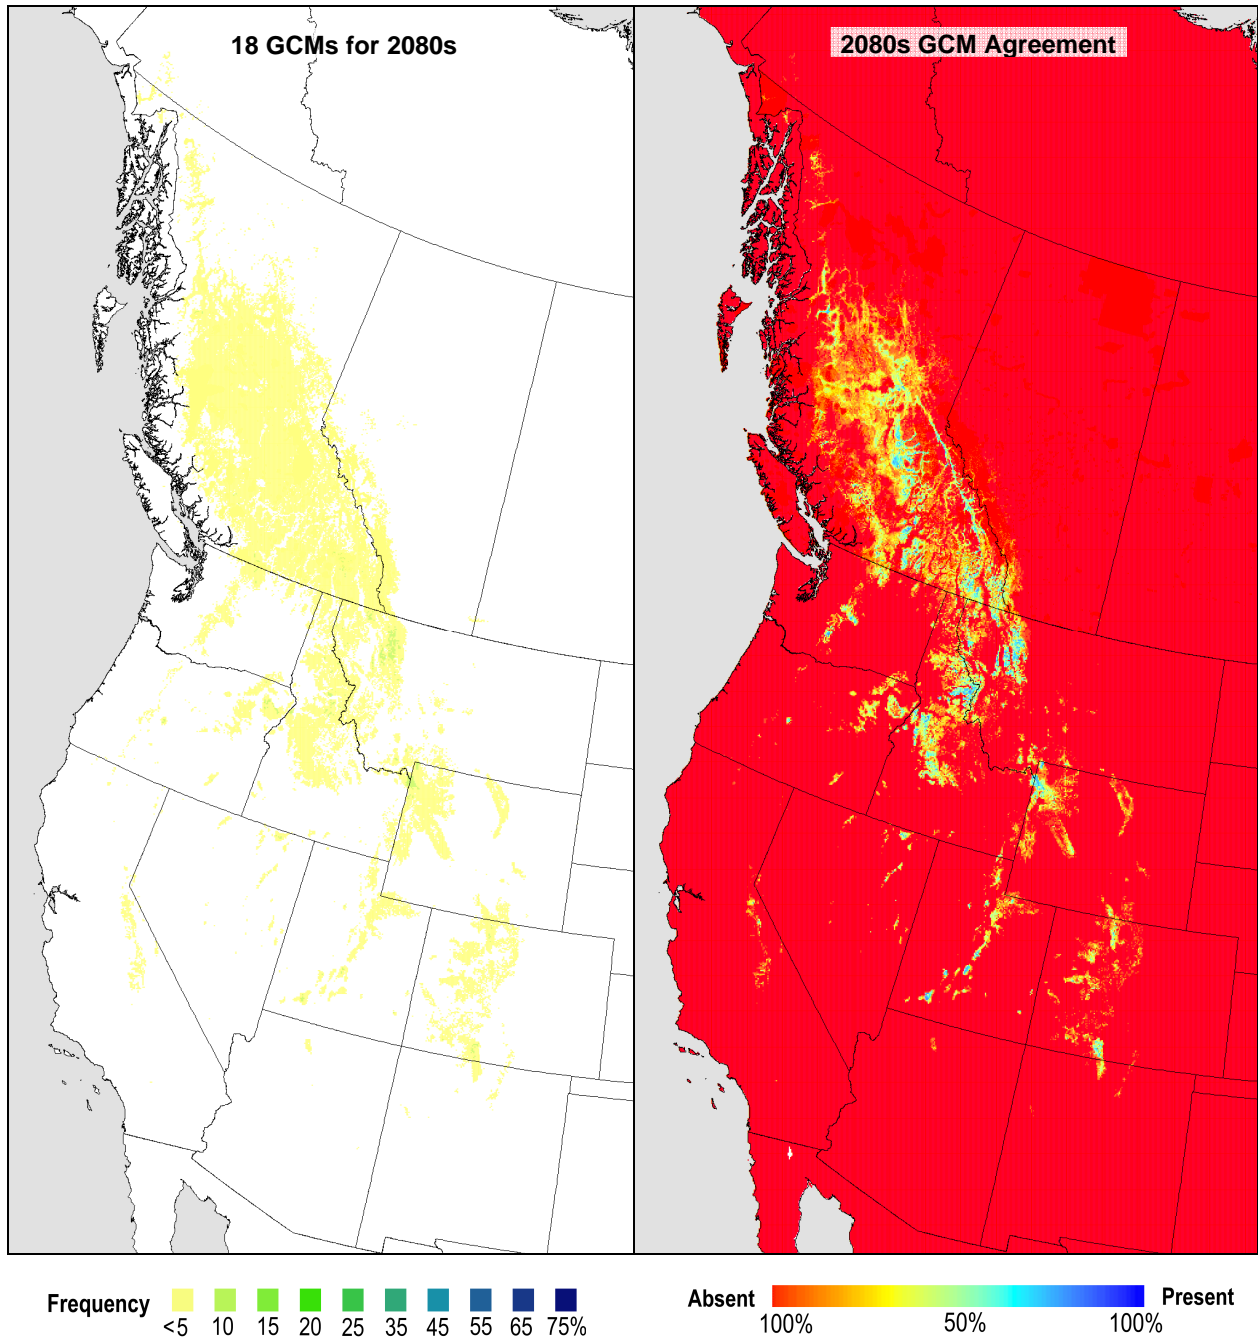

**Figure S11b.** Projected habitat of western larch for the 2011–2040 normal period according to 18 climate change projections. The left image is an average expected frequency (% canopy cover projected to the ground). The right image represents agreement of species presence/absence projections for 18 general circulation models.

### Western larch – 2050s

**Figure S11c.** Projected habitat of western larch for the 2041–2070 normal period according to 18 climate change projections. The left image is an average expected frequency (% canopy cover projected to the ground). The right image represents agreement of species presence/absence projections for 18 general circulation models.

### Western larch – 2080s

**Figure S11d.** Projected habitat of western larch for the 2071–2100 normal period according to 18 climate change projections. The left image is an average expected frequency (% canopy cover projected to the ground). The right image represents agreement of species presence/absence projections for 18 general circulation models.
