Fuel Treatment Idol?

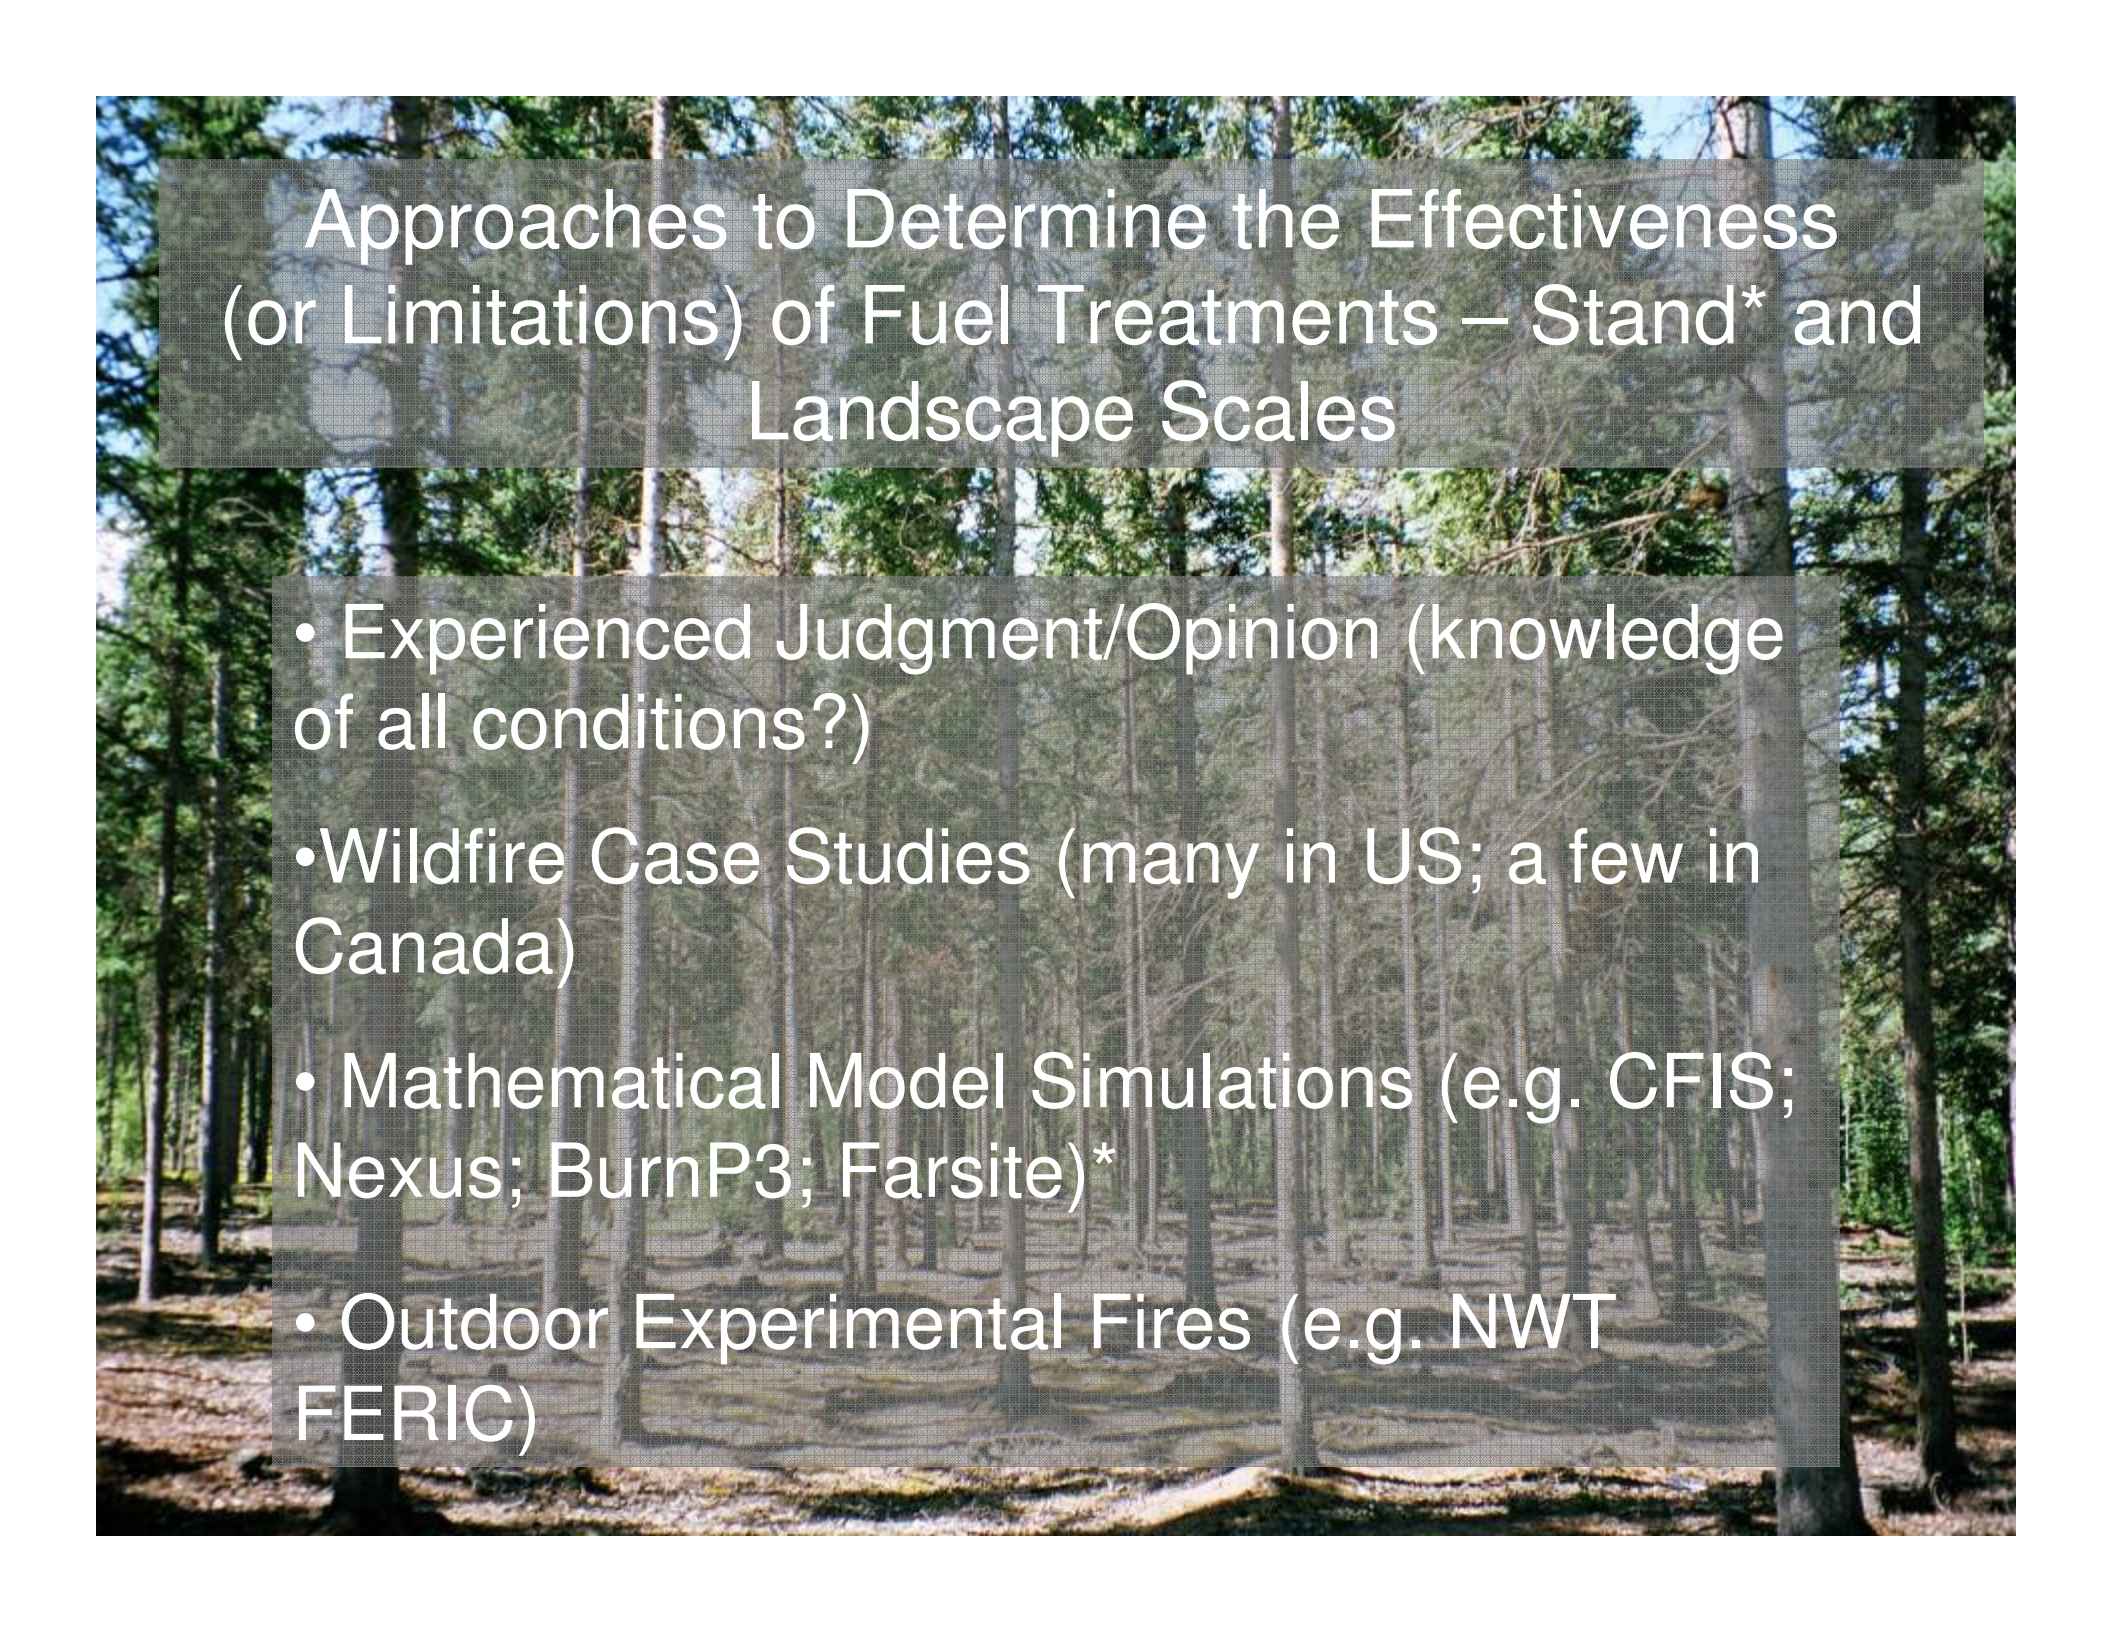

What is an Effective Fuel Treatment (Break)

- Significantly alters fire behaviour such that fire suppression efforts can safely mitigate fire spread to values (Mooney 2010)
- How do you determine this?

How will fuel treatments be used in fire suppression strategies and what can add to their effectiveness?

Approaches to Determine the Effectiveness (or Limitations) of Fuel Treatments – Stand* and Landscape Scales

- Experienced Judgment/Opinion (knowledge of all conditions?)
- Wildfire Case Studies (many in US; a few in Canada)
- Mathematical Model Simulations (e.g. CFIS; Nexus; BurnP3; Farsite)*
- Outdoor Experimental Fires (e.g. NWT FERIC)

Stand Fuel Treatment Goals

Photo Credit: FERIC

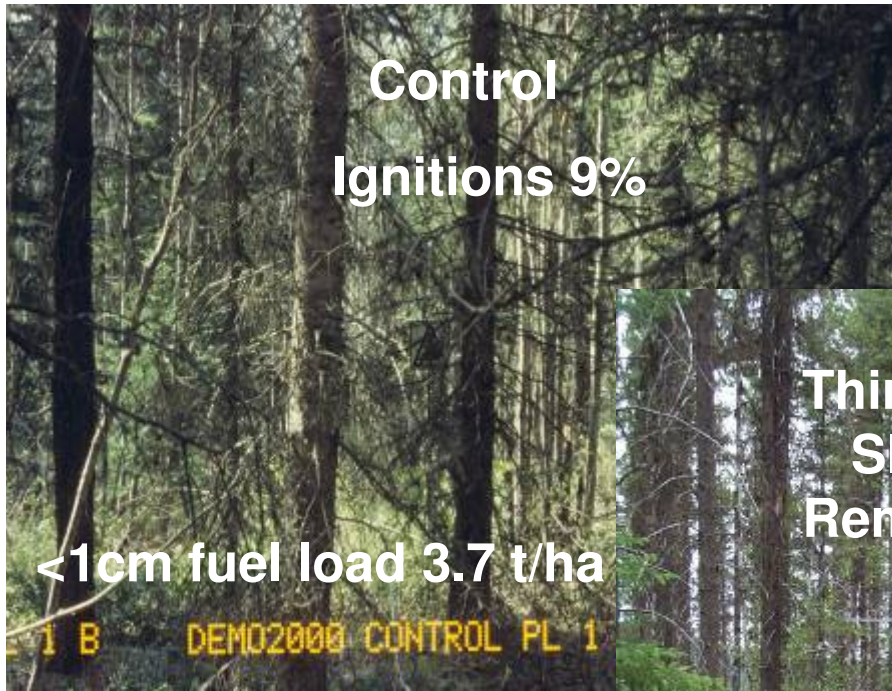

- Slow Surface and Crown Fire Spread Rate and Lower Fire Intensity
- Change Fire Type from Active Crown Fire to Passive or Surface Fire
- Lower ignition probability – fire starts and growth rate
- Reduce Above and Below Ground Fire Severity

Fuel Treatment Objectives to Meet Goals and Attributes to Monitor

SW Yukon Fuel Treatment Pilot Program

“How do we evaluate our plans / treatment areas for success?”

- Prescription compliance

To assess whether or not fuel treatment work carried out in the past was consistent with the fuel treatment prescriptions

- Effectiveness monitoring *

To assess whether or not the treatments were effective in reducing the risk of a crown fire developing in these stands.

Fine Fuel Moisture differences between thinned and unthinned taken from Whitehead et al 2005 study

SOFTWARE CAN ASSESS FUEL TREATMENT EFFECTIVENESS ON CROWN FIRE BEHAVIOR

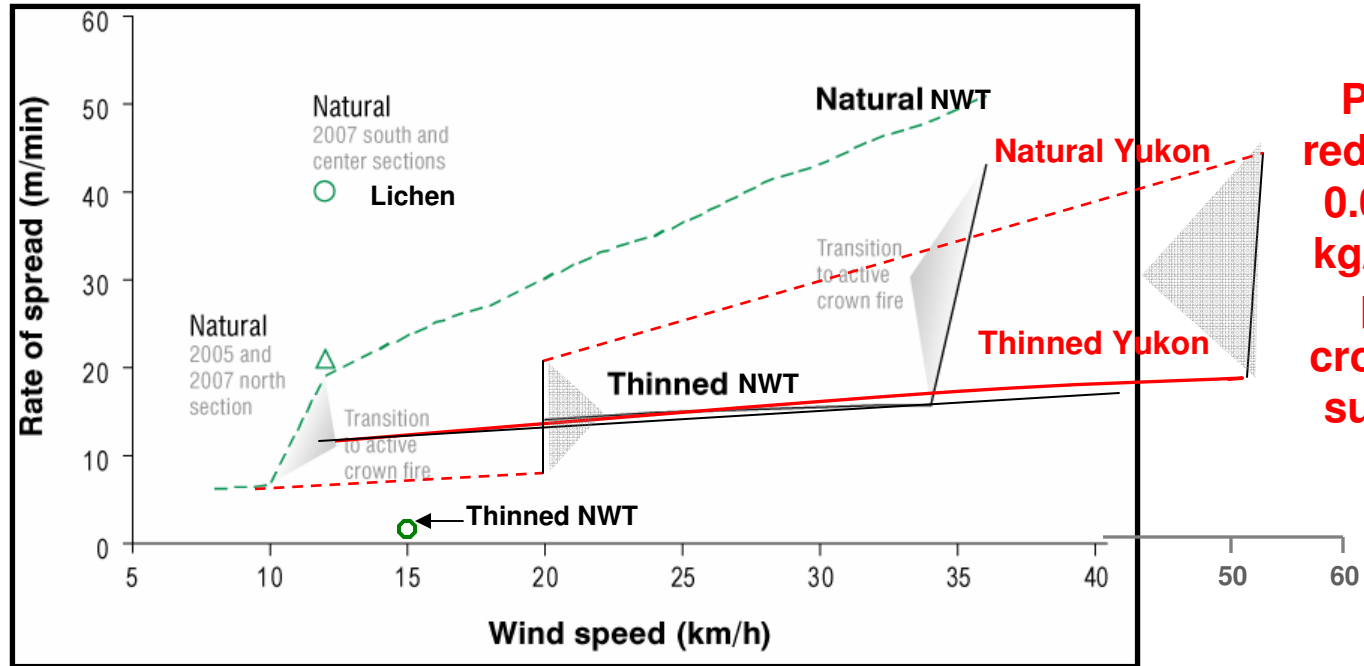

The main outputs of CFIS are its ability to determine the:

- Likelihood of crown fire initiation or occurrence,
- Type of crown fire (active vs. passive) and its rate-of-spread, and
- Minimum spotting distance required to increase a fire's overall forward rate-of-spread.

FERIC NWT Jack Pine – FFM – 8% (Pre 11.4% Post 10%)

100-150 m
Spotting-
Most Common
Fuel Break
width 150-
200m (Mooney
2010)

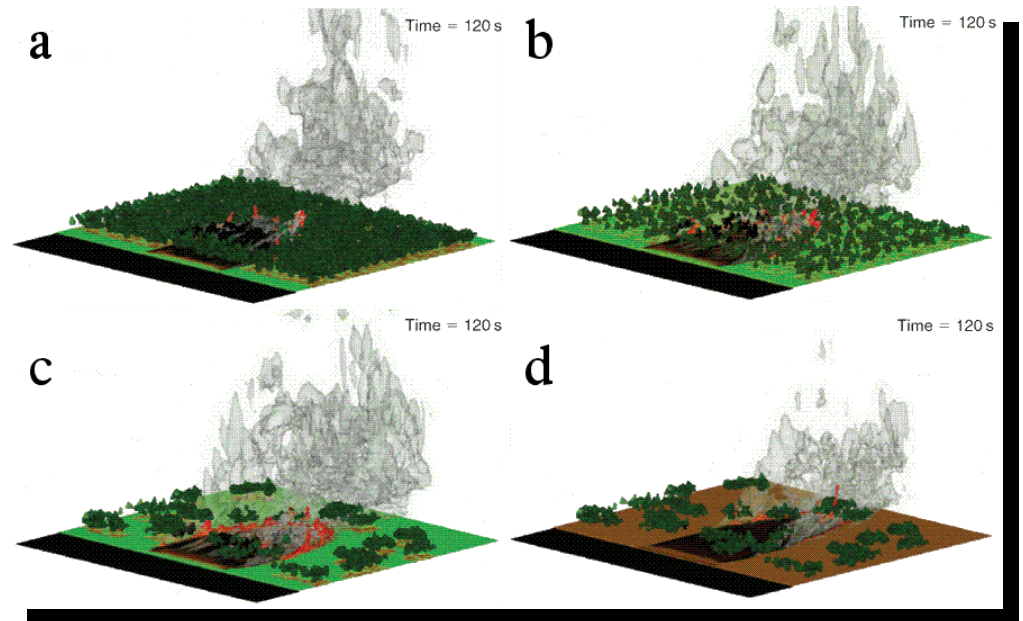

Red – Yukon Canyon 1-4	Thinned	Natural
Density (stems/ha) (Spruce)	500 (391)	2340 to 5000 (1291)
Mean crown spacing (m)	3.6 (3.5)	n.a.
LCBH (m)	9.8 (3.0) ***	(0.80) (0.80)
CBD (kg/m³)	0.07 (0.07)	0.16 (0.18)
Woody (kg/m²) ≤7 cm	1.52 (0.60) ***	0.76 (0.60)

Other Models?

Wildland Fire Dynamics Simulator (NIST)

FIRETEC (LANL)

Maintenance and Monitoring

- Frequency of re-assessment? 5, 10yrs?
- What to measure?
- Insects, thinning damage, disease, flammable vegetation response, windthrow

Wildland Urban Interface and Beyond: Combined Approach? Opportunities?
